To the Undergraduate Admissions Committee,

I am happy to recommend Dibias Boro, whom I have taught Computer Science for the past three years. Although I have not known him as long as some of his other teachers, these three years have been enough for me to understand the kind of learner he is. He is curious, patient, and always interested in knowing how things work instead of simply making them work.

One of the things I appreciate most about Dibias is the way he approaches problems. He does not immediately ask for answers whenever he gets stuck. He spends time thinking, trying different ideas, and looking for the mistake himself before asking for guidance. I have seen him become frustrated over a small coding error that turned out to be nothing more than a missing character or a wrong connection. I have also seen the excitement on his face when the program finally runs the way he wanted. Those moments may seem small, but they tell me that he genuinely enjoys building things and learning through the process.

I still remember the day he came to me after his grandfather's younger brother lost his life in a mining accident. Instead of only talking about the tragedy, he spoke about an idea he had for a device that could warn workers outside the mine if dangerous conditions developed underground. I found that conversation meaningful because he was not thinking about building something impressive. He was thinking about solving a real problem that had affected people close to him.

Over the following months, we worked together on developing a LoRa-based helmet-mounted mining safety device. It was not a perfect project, and like most student projects, it went through many rounds of trial and error. We spent time fixing wiring problems, debugging code, and testing communication between the transmitter and receiver. What impressed me was not that everything worked immediately, but that Dibias never lost interest when things failed. He treated every problem as something to understand rather than something to avoid.

Today many students enjoy creating software and experimenting with new technologies. There is nothing unusual about that. What makes Dibias different, in my opinion, is that he likes building projects that solve practical problems. His ideas usually begin with something he has personally seen or experienced, and that gives his work a sense of purpose. I believe this is a valuable quality for any future engineer or computer scientist.

During the past three years we have worked on several other small projects together, and each one has shown me the same quality. He thinks carefully before making decisions, accepts suggestions, and is willing to improve his work when something is not right. He is not interested in taking shortcuts simply to finish first.

I am pleased to recommend Dibias for undergraduate study. I believe he has the curiosity, patience, and practical way of thinking that will help him continue learning and growing in university. I look forward to seeing what he builds in the years ahead.

Sincerely,

Sharmila Gayari
Computer Science Teacher
